## Presentation

### Mercosur Consolidated Angus Sire Summary 2013 Argentina – Brazil – Uruguay

The National Angus Cattle Evaluation programs that are produced in different countries like Argentina, Brazil and Uruguay have been and will be a very important tool to objectively select sires for producing directional changes in the breeding programs in our countries. Those programs were established more than twenty years ago. Consequently, there is a lot of academic work. These programs involved a lot of work among our Angus Associations/Societies, their breeders and researchers. We have been learned together through this process in order to improve the beef cattle production in the Mercosur.

Although the three mentioned National Angus Cattle Evaluation programs are very relevant due to the permanent and increasing commercial interchange of germplasm (seedstock, semen, embryos) among our countries, it is a new challenge for us to show the breeders how the sires EPD predicted in one country are going to produce directional changes in another country. However, all the breeders know that EPD from the same Angus sires in different National Evaluation programs can not be compared due to different factors like: record bases, number of daughters and sons per sire, genetic bases (fixed, moving, or fixed in different years), genotype-environment interaction, among others. However, if we consider that the EPD predicted in our National Evaluation programs use records that come from similar production systems, the last mentioned factor would not be so important. We must evaluate in the near future the genotype-environment interaction.

In the present, for our breeders from Argentina, Brazil and Uruguay is very difficult to take decisions looking three sources of information. Then, one approach to solve in some extent the problem would be to unify the records keeping and to produce a unique evaluation program. At the present, this is not an option due to other kind factors.

Another alternative and the best solution at this moment would be to produce consolidated EPD according to Dr. Larry Shaeffer (1999), Dr. John Pollak et al. (2002 Simmental), Dr. Z. Zhang (2002), Dr. Vanerlei Rosso, Dr. Fernanda Brito et. al. (2008). The methodology for calculating consolidated EPD is similar to the methodology applied in MACE (Multiple Across Country Evaluation) developed by Dr. Larry Shaeffer at the University of Guelph, Canada. It was necessary to use deregressed EPD in order to make the right adjustments to produce the “**3° Mercosur Consolidated Angus Sire Summary 2013**”. We thank to **711 Angus** breeders from Argentina (433), Brasil (149) and Uruguay (129), who collaborated with the present publication.

## Presentación

### Resumen de Padres Angus Consolidado del Mercosur - 2013 Argentina - Brasil - Uruguay

Los Programas Nacionales de Evaluación de Reproductores Angus que se producen en Argentina, Brasil y Uruguay han sido y serán una herramienta muy importante para seleccionar objetivamente los toros para producir cambios direccionales en los programas de mejoramiento en dichos países. Estos programas se establecieron hace más de veinte años. En consecuencia, hay una gran cantidad de trabajo académico. Estos programas son el resultado de un trabajo conjunto entre nuestras Asociaciones Angus / Sociedades, sus criadores y los investigadores. Hemos aprendido juntos a través de este proceso con el fin de mejorar la producción de ganado de carne en el Mercosur.

Si bien, los tres mencionados Programas Nacionales de Evaluación de Reproductores Angus son muy importantes debido al intercambio comercial permanente y creciente de germoplasma (reproductores, semen, embriones) entre nuestros países, es un nuevo desafío para nosotros mostrar a los criadores cómo DEPs de toros evaluados en un país van a producir cambios de dirección en otro país. Sin embargo, todos los criadores saben que DEPs de los mismos toros Angus en diferentes programas nacionales de evaluación no se pueden comparar debido a diferentes factores como: las bases de datos, número de hijos e hijas por toro, las bases genéticas (fijas, móviles o fijas en diferentes años), interacción genotipo-ambiente, entre otros. Sin embargo, si tenemos en cuenta que para predecir los DEPs en nuestros programas nacionales de evaluación se utilizan registros que provienen de sistemas de producción similares, el último factor mencionado no sería tan importante. Debemos evaluar en un futuro cercano la interacción genotipo-ambiente.

En la actualidad, es muy difícil para nuestros criadores de Argentina, Brasil y Uruguay tomar decisiones usando tres fuentes de información. Entonces, un enfoque para resolver en cierta medida el problema sería unificar los registros y producir un programa único de evaluación. En la actualidad, esto no es una opción debido a factores de otra índole.

Otra alternativa, y la mejor solución en este momento, sería producir DEPs consolidados, según el Dr. Larry Shaeffer (1999), el Dr. John Pollak et al. (2002 Simmental), el Dr. Z. Zhang (2002), el Dr. Vanerlei Rosso, Dra. Fernanda Brito et. al. (2008). La metodología de cálculo de DEPs consolidados es similar a la metodología aplicada en MACE (*Multiple Across Country Evaluation*, Evaluación a través de Múltiples Países) desarrollado por el Dr. Larry Shaeffer en la Universidad de Guelph, Canadá. Fue necesario el uso de DEPs derregredidos a fin de hacer los ajustes necesarios para producir el “**3º Resumen de Padres Angus Consolidado del Mercosur 2013**”. Agradecemos a los **711** criadores Angus de Argentina (433), Brasil (149) y Uruguay (129) que hicieron posible el mencionado trabajo.

## Apresentação

### Sumario Consolidado de Touros Angus do Mercosul – 2013 Argentina-Brasil-Uruguai

Os Programas de Avaliação Nacional da raça Angus desenvolvidos nos diferentes países como Argentina, Brasil e Uruguai têm sido uma importante ferramenta para, objetivamente, selecionar touros que produzam mudanças direcionais nos programas de melhoramento genético em nossos países. Estes programas foram estabelecidos há mais de vinte anos atrás e, conseqüentemente há muito trabalho técnico desenvolvido. Nossas Associações de Angus, através de seus produtores e técnicos dedicaram muito trabalho nestes programas. Nós temos aprendido juntos neste processo com o propósito de melhorar a produção de gado de corte no MERCOSUL.

Embora os três Programas Nacionais de Avaliação da raça Angus mencionados sejam muito relevantes devido a permanente e crescente troca comercial de germoplasma (reprodutores, sêmen, embriões) entre nossos países, é um novo desafio para nós mostrar aos criadores como as DEP dos touros preditas em um país irão produzir mudanças direcionais em outro país. No entanto, todos os criadores sabem que as DEP dos mesmos touros em diferentes Programas de Avaliação Nacional de gado de corte não podem ser comparadas devido a diferentes fatores como: base de dados, número de filhas e filhos por touro, base genética (fixa, móvel ou fixa em diferentes anos), interação genótipo-ambiente, entre outros. Porém, se nós considerarmos que as DEP preditas em nossos programas nacionais de avaliação usam dados provenientes de sistemas de produção similares, o último fator citado poderia não ser tão importante. Ainda assim teremos que avaliar, num futuro próximo, a interação genótipo-ambiente.

Para nossos criadores da Argentina, Brasil e Uruguai é muito difícil tomar decisões olhando três fontes de informação. Então, uma opção para resolver, em parte, o problema poderia ser unificar a base de dados e produzir um único programa de avaliação. Atualmente esta não seria uma opção devido a outros tipos de fatores.

Uma alternativa, sendo a melhor solução no momento, poderia ser produzir DEP consolidadas de acordo com Dr. Larry Shaeffer (1999), Dr. J. Pollak et al. (2002 Simmental) and Dr. Z. Zhang (2002), Dr. Vanerlei Roso, Dr. Fernanda Brito et. al. (2008). A metodologia para calcular DEP consolidadas é similar à metodologia aplicada no MACE (*Multiple Across Country Evaluation*) desenvolvida por Dr. Larry Shaeffer da Universidade de Guelph, Canada. Para isto foi necessário usar as DEP desregredidas para fazer os ajustamentos adequados para produzir a “**3º Sumario Consolidado de Touros Angus do Mercosul - 2013**”. Agradecer a todos os **711** criadores de Angus da Argentina (433), Brasil (149) e Uruguai (129) que fizeram possível o mencionado trabalho.

## 1. RANGOS DE D.E.P., PERCENTILES Y CAMBIO POSIBLE

### RANGOS DE D.E.P.

Para cada característica de importancia económica hay un DEP máximo y un DEP mínimo, conformando lo que se denomina un rango de DEP, ya que estos se distribuyen entre esos dos valores extremos. El rango de DEP puede variar entre un Resumen de Padres y otro. En la **Tabla 1** se muestra la cantidad de toros evaluados, el número de registros totales analizados, la contribución por país y los rangos de DEP para las distintas características consideradas en el presente “3° Resumen de Padres Angus Consolidado del Mercosur”, con sus correspondientes unidades.

Los rangos expuestos en esta **Tabla 1** son de utilidad, pues ayudan a interpretar la selección de un determinado reproductor en base a DEP, y a ver dentro de estos valores extremos dónde él mismo está ubicado. Esto le permitirá predecir si usted se moverá en la dirección deseada de acuerdo a sus objetivos de selección. *Recuerde que es usted quien fija las metas de selección. El Resumen de Padres es sólo una herramienta objetiva para llegar a ellas, pero no fija direcciones en uno u otro sentido.*

TABLA 1. RANGO DE DEP DE LOS TOROS PADRES POR CARACTERÍSTICA

	CANT. TOROS	CANT. REG.	ARG.	BRA.	URU.	RANGO DE DEP	UNIDAD
PN	2260	397656	279458	69404	48794	-2.8 a 3.1	Kilos
PD	2260	354483	244567	62484	47432	-24.2 a 18.2	Kilos
HM	1321	123704	89863	17852	15989	-11.1 a 10.6	Kilos
PF	2093	208138	135744	40943	31451	-37.0 a 34.2	Kilos
CE	1949	97830	76039	9156	12635	-1.7 a 1.7	Kilos
AOB	1583	70246	43971	5092	21183	-5.0 a 5.8	cm <sup>2</sup>
EGD	1572	68542	43017	4499	21026	-1.5 a 1.6	mm

Referencias: (ARG: Argentina; BRA: Brasil; URU: Uruguay)

### PERCENTILES

Se sabe que la evaluación en DEP de un toro está dentro de un rango, propio de la característica evaluada (**Tabla 1**). Sin embargo, ese rango es útil como primera aproximación, ya que no nos permite precisar en qué posición se ubica (en términos de porcentaje) el toro seleccionado dentro de toda la población evaluada.

Por tal motivo, en la **Tabla 2** de este Resumen de Padres AnGus Consolidado presentamos los porcentajes de toros padres, por encima o por debajo de determinados valores de DEP –también conocidos como percentiles–, tanto para las características de crecimiento como para las carniceras, con el propósito que los criadores y productores comerciales puedan interpretar de manera más precisa su distribución y ubicación relativa de los mismos.

En tal sentido, cuando el usuario del Resumen de Padres AnGus Consolidado busca, por ejemplo, un toro para usar en vaquillonas, seguramente elegirá el que tenga un DEP negativo para peso al nacer. Pero con la ayuda de la **Tabla 2** ahora puede ser más preciso: seleccionar aquel que no sólo sea negativo, sino que se ubique, por ejemplo, dentro del 5% de los más negativos. En este caso, la **Tabla 2** nos indica a partir de qué valor negativo de DEP para peso al nacer se acumula el 5% de los toros más negativos.

Por el contrario, si se desea seleccionar toros con DEP positivo para incrementar cierta característica, la **Tabla 2** brinda la misma utilidad. Pero en este caso hay que ser cautelosos. Por ejemplo, si se quiere aumentar leche, está bien elegir toros con DEP positivo para esta característica, pero hay que tener cuidado de que no sean extremadamente positivos, pues en un futuro se podría ver afectada la eficiencia reproductiva de los vientres. Esto también es válido para otros rasgos, como peso al destete y peso final, pues los DEP extremadamente altos probablemente conduzcan a un aumento de tamaño corporal con sus correspondientes consecuencias negativas.

Otra ventaja de los percentiles, respecto de los rangos de DEP, es que describe con más exactitud si los toros seleccionados son extremos o moderados dentro de cada característica evaluada. A continuación presentamos la Tabla 2 de Percentiles.

**TABLA 2. PERCENTILES: PORCENTAJES DE TOROS PADRES POR ENCIMA O DEBAJO DE DETERMINADOS VALORES DE DEP**

	CARACTERÍSTICAS PARA:						
	CRECIMIENTO			CALIDAD CARNICERA			
	DEP PN	DEP PD	DEP LECHE	DEP PF	DEP CE	DEP AOB	DEP EGD

**Referencias:** PN (peso al nacer), PD (peso al destete), LECHE (leche), PF (peso final), CE (circunferencia escrotal), AOB (área de ojo de bife), EGD (espesor de grasa dorsal).

## ¿Qué significa Accuracy (Accu)?

La sigla Accu significa Accuracy o Precisión, y todo DEP va acompañado de una Accu. La Accu, como ya ha sido definida, indica la confiabilidad en el DEP que acompaña: en qué grado el DEP predice el verdadero valor genético aditivo de un animal para cualquier característica considerada en el Resumen de Padres. La Accu varía de 0 a 1, aproximándose a 1 cuando mayores son las fuentes de información utilizadas para la predicción de un DEP. La aproximación a valores más altos depende de varios factores: de la característica y su heredabilidad, de la correlación genética entre los diferentes caracteres asociados (Multiple Trait Model) y de las distintas fuentes de información utilizadas para obtener los DEP de los reproductores. En un toro padre, uno puede tener como fuentes de información: su propia performance o no, la de sus hijos y la información de otros parientes que surjan del pedigree de dicho toro o vientre. A su vez, si un toro padre tiene hijos en un mayor número de grupos contemporáneos o rodeos, esto incide favorablemente en su Accu. Todos los factores mencionados transforman el número real de crías de un toro padre en lo que académicamente se denomina “Número Efectivo de Progenies”, lo cual tiene mucha influencia en la Accu. Por los motivos mencionados, toros padres con igual número de crías reales pueden tener diferentes Accu porque su “Número Efectivo de Progenies” es diferente.

Con el propósito de ilustrar cómo varía el significado de la Accu en los toros padres o vientres y orientar al criador, mostramos la **Tabla 3**, que está basada en el número de crías (hijos/hijas) más las distintas fuentes de información previamente mencionadas, lo que generan distintas Accu. A su vez, presentamos diferentes columnas, pues las características con mayor heredabilidad tienden a incrementar más rápida su Accu, con menor número de crías. A su vez, la Accu sube más rápido si el toro padre o vientre no sólo tiene más hijos/as, sino también, si cuenta con su propia performance.

**TABLA 3. ACCURACIES (Accu) o PRECISIONES ORIENTATIVAS DE ACUERDO A LA HEREDABILIDAD DE CADA CARACTERÍSTICA, CON DIFERENTE CANTIDAD DE CRÍAS Y CON Y SIN PROPIA PERFORMANCE**

CANTIDAD DE CRIAS	HEREDABILIDAD 0,30 (PESO AL DESTETE)		HEREDABILIDAD 0,50 (CE y ALTURA)	
	Sin propia performance	Con propia performance	Sin propia performance	Con propia performance
10 hijos	0,48	0,68	0,67	0,81
20 hijos	0,68	0,75	0,78	0,85
100 hijos	0,85	0,87	0,92	0,93
1000 hijos	0,97	0,98	0,99	0,99

### Nota:

- Estos valores podrán variar de acuerdo con la información del pedigree de cada reproductor en particular.
- A los reproductores que no están en 3 rodeos, su Accu no se la deja subir más de 0,85.
- A los reproductores que sólo tienen DEP de Pedigree, su Accu está predeterminada en 0,05.

Es decir, la Accu siempre varía entre 0 y 1; al estar más cerca de 1, el DEP es más confiable. La Accu de un toro es mayor si tiene propia performance, y se incrementa a medida que se cuenta con mayor cantidad de hijos con información y, desde ya, depende de la heredabilidad del carácter evaluado y de la correlación genética de las características evaluadas conjuntamente (Multiple Trait Model). Al incorporar nueva información a un padre con alta Accu, ésta cambiará menos en el siguiente Resumen de Padres, que la de un toro con baja Accu.

## ¿Se pueden comparar dos toros con diferente Accu?

Sí, ya que los DEP están ajustados por la diferente cantidad de información disponible. En este caso, la Accu nos indica el mayor o menor riesgo que corremos al elegir uno u otro toro. Sin embargo, Ud. tenga en cuenta que a menor Accu mayor cambio posible.

### CAMBIO POSIBLE Asociación entre la Accu de un DEP y su Cambio Posible

La **Tabla 4** lista los valores de los denominados "Cambios Posibles" asociados con los distintos niveles de Precisión (Accu) de los DEP, para las diferentes características evaluadas y para cualquier reproductor. Aquí hemos tomado como referencia la tabla del programa ERA (Evaluación de Reproductores AnGus). El Cambio Posible está expresado en unidades positivas y negativas de DEP y lo podemos definir de la siguiente manera: Es el cambio esperado (o potencial desviación) entre el DEP calculado (listado) y el "verdadero" mérito genético (DEP) de cada reproductor, para la correspondiente característica evaluada. Nunca podemos conocer el "verdadero" mérito genético de un reproductor, pero sí nos podemos ir aproximando a él a medida que tenemos mayor cantidad de información para calcularlo.

Para una dada Accu, un reproductor debería tener su "verdadero" mérito genético (DEP) alrededor del 67% de las veces, dentro del rango del DEP (listado)  $\pm$  el valor del Cambio Posible, expresado en la mencionada **Tabla 4**. Este rango de confianza depende del error estándar de predicción de cada DEP calculado (listado).

**TABLA 4. CAMBIO POSIBLE DE LOS DEP, SEGÚN SU PRECISIÓN**

Accu	DEP LG	DEP PN	DEP PD	DEP LECHE	DEP PF	DEP CE	DEP ALT	DEP AOB	DEP EGD	DEP EGC	DEP %GI	DEP %CM

Pongamos el siguiente ejemplo. Un toro padre con un DEP para Peso al Nacer de + 2,0 y una Accu de 0,65, de acuerdo con la **Tabla 4** se esperaría que su “verdadero” mérito genético (DEP) esté dentro del rango  $2 \pm 0,39$ , es decir de 1,61 kilos a 2,39 kilos, con un 67 % de confianza.

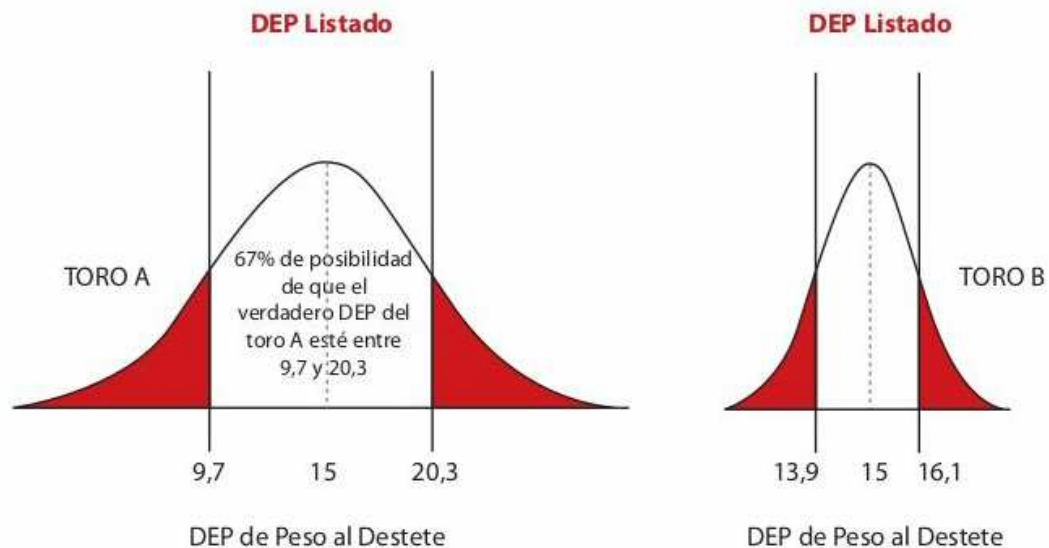

El valor de la Accu puede variar de 0 a 1 para cualquier característica. El significado del valor de la Accu que acompaña a un DEP es el mismo, independientemente de la característica evaluada, es decir esa Accu de 0,65 tiene la misma interpretación. Sin embargo, los valores del Cambio Posible son diferentes para cada característica, dado que reflejan las distintas variancias genéticas (aditivas) asociadas a cada una de ellas.

Si observamos la **Tabla 4** vemos que, a medida que aumenta la Accu (más información) disminuye el Cambio Posible. Esto se debe a que el DEP calculado está muy próximo al “verdadero” mérito genético (DEP) del reproductor evaluado, por lo que la diferencia entre el DEP calculado (listado) y el DEP “verdadero” es menor (se reduce el rango) a medida que aumenta la Accu. Es decir, a través de nuestras evaluaciones genéticas (Resúmenes de Padres), nos vamos acercando paulatinamente al “verdadero” mérito genético del reproductor, pues periódicamente vamos incorporando más información sobre él (más hijos/as). En conclusión, el concepto básico a recordar es que, a medida que la Accu aumenta, el Cambio Posible disminuye.

A continuación presentamos dos ejemplos numéricos, para ilustrar el concepto y la interpretación entre los valores del Cambio Posible y la Accu.

	<b>TORO A</b>	<b>TORO B</b>
<b>DEP Peso al Destete</b>	<b>+15 kilos</b>	<b>+15 kilos</b>
<b>Accu</b>	<b>0,25</b>	<b>0,85</b>
<b>Cambio Posible</b>	<b>±5,3 kilos</b>	<b>± 1,1 kilos</b>
<b>67% de las veces, el DEP "verdadero" estará entre:</b>	<b>+9,7 y +20,3 kilos</b>	<b>+13,9 y + 16,1 kilos</b>

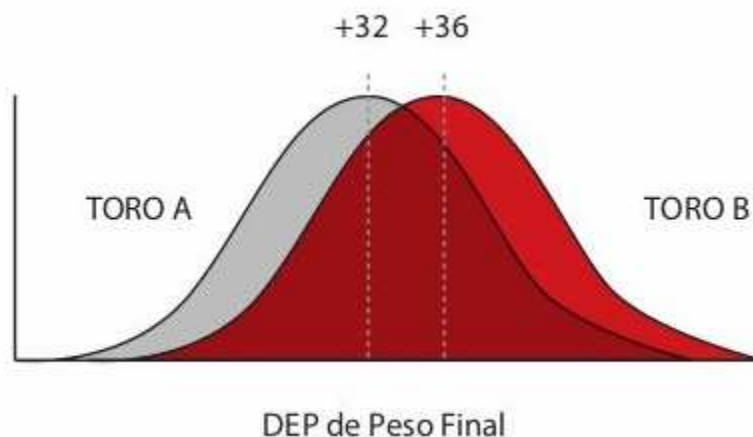

**Ejemplo 1.** Ilustración del concepto de valores de Cambio Posible, asociados con diferentes niveles de Accu e iguales DEP de peso al destete.

El **Ejemplo 1** se refiere a los toros padres A y B, que poseen iguales DEP de peso al destete (+ 15), pero distinta Accu. En el caso del Toro A, con una Accu de 0,25, su “verdadero” mérito genético (DEP) estará entre 9,7 kilos y 20,3 kilos, en el 67% de las veces, mientras existe una probabilidad del 33% que esté fuera de dicho rango. Por el contrario, en el Toro B, que tiene mayor Accu (0,85), su Cambio Posible, de acuerdo a la **Tabla 4**, es de sólo  $\pm 1,1$ , por lo que su verdadero mérito genético está más próximo al valor listado (calculado) en el Resumen de Padres. Esto demuestra que, a medida que tenemos más información (Accu más alta) para calcular su DEP, paulatinamente nos vamos acercando al verdadero mérito genético que queremos predecir.

	<b>TORO A</b>	<b>TORO B</b>
<b>DEP Peso Final</b>	<b>+32 kilos</b>	<b>+36 kilos</b>
<b>Accu</b>	<b>0,25</b>	<b>0,25</b>
<b>Cambio Posible</b>	<b><math>\pm 7,4</math> kilos</b>	<b><math>\pm 7,4</math> kilos</b>
<b>67% de las veces, el DEP "verdadero" estará entre:</b>	<b>+24,6 y 39,4 kilos</b>	<b>+ 28,6 y + 43,4 kilos</b>

**Ejemplo 2.** Ilustración del concepto de valores de Cambio Posible, asociados con iguales niveles de Accu y diferentes DEP de peso final.

El **Ejemplo 2** es para la característica de peso final. A diferencia del ejemplo anterior, éste nos muestra dos toros padres con iguales Accu, pero distintos DEP para esa característica, por lo que, de acuerdo con la **Tabla 4**, tendrán el mismo Cambio Posible para peso final. Por lo tanto, para ambos toros, su rango de Cambio Posible será el mismo.

**TERNEZA: SELECCIÓN ASISTIDA POR  
MARCADORES MOLECULARES (S.A.M.)**

La variante alélica de mayor terneza de un marcador se identifica, por “simplicidad” con (+) y la de menor terneza con (-). Por lo tanto, para cada marcador, los animales pueden ser ++ (homocigota para mayor terneza), -- (homocigota para menor terneza) ó +- (heterocigota).

El genotipo más favorable a la terneza (6 positivos) para CAST2959, CAPN1316 y CAPN14751 es ++ ++ ++, respectivamente, mientras que el menos favorable a la terneza es -- -- --. Dentro de estas dos variantes extremas tenemos 27 combinaciones posibles que indican mayor o menor terneza (o fuerza de corte), de acuerdo a cómo se presenten estos tres marcadores moleculares en un reproductor (o genotipo) en particular. Estos son los marcadores moleculares que usa GeneSTAR®. Lo mencionado anteriormente es válido si se reemplaza CAST2959 por CASTUoG, dado que Igenity® usa este último marcador para calpastatina. La diferencia entre estos reproductores, de acuerdo a sus genotipos, según el citado trabajo de validación (Journal of Animal Science, 2007), podría llegar a ser de 1 kilo en menor fuerza de corte, independientemente del marcador molecular que usen para calpastatina cualquiera de las dos empresas mencionadas. No existe una validación que confirme esta magnitud en la Argentina. Sin embargo, y sin ninguna duda, estos cuatro marcadores moleculares están –en mayor o menor medida– asociados a la terneza, siendo la SAM una nueva herramienta que no tendríamos que desaprovechar. Quizá, en un futuro próximo surjan más marcadores moleculares que expliquen o agreguen más a lo aquí expuesto, pero en la actualidad esto es lo que la comunidad científica nos está brindando.

Si observa el listado de toros padres AnGus incluidos en este Resumen, tiene la oportunidad, por primera vez en la Argentina, de seleccionar un reproductor por terneza, haciendo uso de cuatro marcadores moleculares asociados a la misma. Pero siempre recuerde que en bovinos de carne no debe seleccionarse por una única característica, sino priorizar las ligadas a reproducción, crecimiento y calidad de carne, en ese orden.

Dado que ya existe información confiable –generada en el país y en el extranjero– sobre la utilidad de los test para terneza con marcadores genéticos, la información sobre las frecuencias génicas relativas de las diferentes variantes de cada marcador en nuestra población AnGus es el primer paso de cualquier programa de mejoramiento genético. Además, el presente trabajo nos permitió debatir la conveniencia de incluir la información sobre los marcadores moleculares de terneza, de aproximadamente 300 toros padres con un gran número de progenies en nuestro Programa ERA.

Este trabajo muestra cómo cada reproductor puede ser actualmente evaluado con “cuatro marcadores moleculares” asociados a terneza, explicitando para cada uno la presencia o ausencia de la variante más favorable de cada marcador, pudiendo de esta forma hacer uso de esta información en trabajos de SAM para una característica tan importante como la mencionada. Cabe destacar que el uso de la SAM es más relevante en las características económicas que tienen baja heredabilidad, son difíciles de medir y/o se miden tardíamente (faena - pruebas de progenie) en los controles de producción. Para otras características, como el veteado o marbling (porcentaje de grasa intramuscular), el poder medir directamente el fenotipo por ecografía, disminuye la importancia de los marcadores moleculares sobre ellas. Cabe destacar que los marcadores moleculares indican una asociación con la característica de interés económico analizada, pero no explican 100% la variación genética total. Sin embargo, cuando es imposible medir directamente cualquier característica de importancia económica, los marcadores moleculares validados se tornan de mayor relevancia. Este es el caso de la terneza.

También es importante subrayar que estos marcadores moleculares son más relevantes en la comercialización de carne fresca, es decir la que se realiza cerca de la faena. En nuestro país, el 80% de la faena tiene como destino el mercado interno dentro de esta modalidad. En el caso de la carne de exportación, que es sometida a procesos de enfriado por un tiempo considerable, el proceso de maduración favorece la tiernización de la misma.

## CABAÑAS ARGENTINAS

A continuación se listan las 433 cabañas Angus del Programa ERA (Evaluación de Reproductores Angus) de la Argentina, cuyos registros de producción contribuyeron a concretar el Resumen de Padres Angus Consolidado del Mercosur 2013.

1. **Nombre** Los toros están listados en orden alfabético de acuerdo a los nombres con que están inscriptos en el registro genealógico de la raza. Además figura el nombre del padre (P) y de la madre (M).
2. **Registro** Es el número del toro listado en el herdbook oficial de origen.
3. **CP** Es el código del país de origen del padre listado.
4. **Año** Es el año de nacimiento del padre listado.
5. **NH** Es el número de crías (PP y/o PC) cuyos registros de performance han sido analizados para evaluar el toro listado en esta característica.
6. **DEP** Los DEP (diferencia esperada entre progenies) predicen cómo se comportará la futura progenie de los toros listados en cada una de las características de producción evaluadas. Los DEP pueden ser positivos (+), negativos (-) o cero (0), y están expresados en la unidad de medida correspondiente a cada característica: kilos si es peso al nacer, o centímetros si es circunferencia escrotal, por ejemplo.
7. **Accu** La Accu (Accuracy o Precisión) indica el grado de confiabilidad que se puede tener en el DEP que acompaña. Una Accu cercana a 1 (uno) indica alta confiabilidad, mientras que cercana a 0 (cero), baja confiabilidad.
8. **Nacer** Este DEP, expresado en kilos, predice la capacidad que tiene el toro considerado para transmitir peso al nacer a su progenie. En el ejemplo se espera que las crías del Toro A pesen, en promedio, 1.2 kilos menos que las del Toro B (+1.4 menos +0.2 = 1.2). El peso al nacer es un indicador de la facilidad de parto; DEP más altos indican, generalmente, mayores problemas de parto (distocia).
9. **Per** El Per (Percentil) indica el porcentaje de toros padres por encima o por debajo de determinados valores de DEP, tanto para las características de crecimiento como para las carniceras, con el propósito que los criadores y productores comerciales puedan interpretar de manera más precisa su distribución y ubicación relativa.

10. **Destete** Este DEP, expresado en kilos, predice la capacidad que tiene el toro considerado para transmitir crecimiento al destete a su progenie. Todos los pesos al destete analizados fueron ajustados a los 205 días y por edad de la madre. En el ejemplo se espera que la progenie del Toro A pese, en promedio, 3.4 kilos menos que la del Toro B (+8.6 menos +5.2 = 3.4).
11. **NN** Es el número de nietos y nietas (PP y/o PC) cuyos registros de performance de destete han sido analizados para evaluar el toro listado en la característica aptitud lechera.
12. **Leche** Este DEP indica la aptitud lechera que transmite un toro a sus hijas, medida a través del peso al destete de sus nietos y nietas. En el ejemplo, las hijas del Toro A brindan una cantidad extra de leche que les permite destetar crías con 7.8 kilos más, en promedio, que las nacidas del Toro B (+6.7 menos -1.1 = 7.8). Es importante destacar, asimismo, que cada hija también transmite a sus descendientes, conjuntamente con esos genes para leche, los genes para crecimiento provenientes de su padre.
13. **Final** Este DEP, expresado en kilos, predice la capacidad que tiene el toro considerado para transmitir crecimiento a sus crías, medido como peso a los 18 meses. En el ejemplo, la progenie del Toro A pesará, en promedio, al año y medio de edad, 5.6 kilos más que la del Toro B (+14.9 menos +9.3 = 5.6).
14. **C.E.** Este DEP, expresado en centímetros y ajustado a los 18 meses, predice la capacidad del toro para transmitir esta característica a su progenie. Nuestro ejemplo indica que los hijos del Toro A tendrán, en promedio, a los 18 meses de edad, 1.2 cm más de circunferencia escrotal que los del Toro B (+1.2 menos +0.0 = 1.2). Recuerde que la circunferencia escrotal es uno de los mejores estimadores de la fertilidad, ya que está asociada con la cantidad de semen producido por el toro y con la edad a la que sus crías ingresan a la pubertad (precocidad sexual); DEP mayores significa que la progenie alcanzará más temprano su madurez sexual.
15. **A.O.B.** Este DEP, expresado en centímetros cuadrados y ajustado a los 18 meses, predice la capacidad del toro para transmitir mayor o menor área de ojo de bife (AOB) a su progenie, dependiendo si su valor es positivo o negativo, respectivamente.
16. **E.G.D.** Este DEP, expresado en milímetros y ajustado a los 18 meses, predice la capacidad del toro para transmitir mayor o menor espesor de grasa dorsal (EGD) a su progenie, dependiendo si su valor es positivo o negativo, respectivamente.
17. **Terneza** El trabajo publicado en el “Journal of Animal Science” de mayo 2007, demostró que los individuos con las variantes alélicas (genéticas) más favorables (+) para los marcadores de calpaína y calpastatina tienen una correlación altamente significativa ( $P < 0,001$ ) con la terneza de la carne, medida mediante WBSF (1 kilo menos de fuerza de corte). Por simplicidad, la variante alélica de mayor terneza se identifica como (+) y la de menor terneza como (-). Por lo tanto, para cada marcador, los animales pueden ser ++ (homocigota para mayor terneza), -- (homocigota para menor terneza) ó +- (heterocigota). El genotipo más favorable a la terneza (6 positivos) para CAST<sub>2959</sub>, CAPN1<sub>316</sub> y CAPN1<sub>4751</sub> es ++ ++ ++, respectivamente, mientras que el menos favorable es -- -- --. Dentro de estas dos variantes extremas tenemos 27 combinaciones posibles que indican mayor o menor terneza (o fuerza de corte), de acuerdo a cómo se presenten estos tres

marcadores moleculares en un reproductor (o genotipo) en particular. El marcador molecular CAST<sub>2959</sub> es usado por la empresa australiana GeneSTAR® mientras que la empresa estadounidense Igenity® utiliza la CAST<sub>UoG</sub>. En consecuencia, todo lo expresado anteriormente es válido. Sólo tiene que reemplazar CAST<sub>2959</sub> por CAST<sub>UoG</sub>. Es decir, la diferencia de menor fuerza de corte es la misma (1 kilo), independientemente del marcador molecular que use para calpastatina, siempre y cuando el genotipo combinado sea el más favorable (++ ++ ++) con respecto al menos favorable (-- -- --).
